

Corrugator Survey

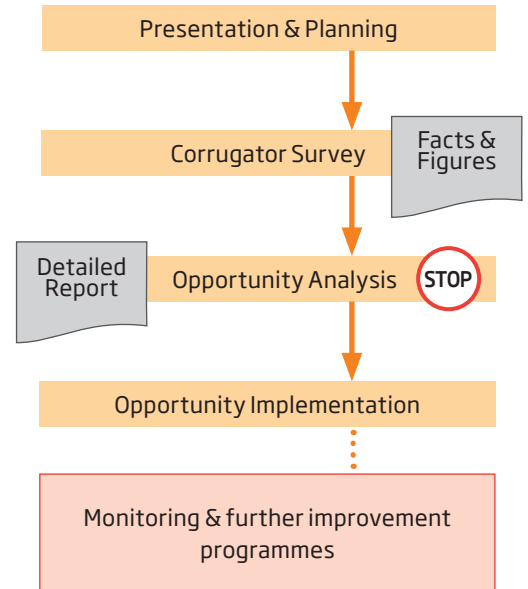

Corrugator Survey is a detailed audit of corrugator conditions, including process improvement programmes.

In this programme we make our expertise and experience available to you in order to search for and evaluate improvement opportunities in your corrugator production machinery. Sometimes small changes can bring important results in terms of efficiencies, cost savings or overall work routine improvements.

The survey starts with a **Presentation & Planning** meeting. This meeting is intended to explain how the audit will be done, define the possible points of measurement, and agree upon the expectations and outcome of the audit. It is the necessary preparation for doing the actual Survey and Data Analysis.

In the analysis our containerboard specialists will visit your production facility in order to run - in close co-operation with your managerial staff - different measurements on your corrugator. These cover reel moisture/temperature, web temperature at different positions, board moisture/temperature, surface and glue line temperature, etc.

The data obtained will enable us to provide you with a detailed report and an **Opportunity Analysis**. The results are presented and discussed with you during a final follow-up meeting, which should initiate an **Opportunity Implementation** programme.

Running the **Corrugator Survey** programme in an open and positive collaboration with our customers has already delivered impressive results in terms of value.

If you are interested, we would be glad to present some cases studies that clearly demonstrate how **only through measuring can improvement become tangible**.
